PRIMERGY TX300 S7

The PRIMERGY TX300 S7 is a no compromise tower server with maximum levels of performance, expandability and availability. It combines the performance of Intel® Xeon® processors E5 family with up to two 6GB general-purpose computing on graphics processing units (GPGPU) for computationally intensive applications.
The expandability is excellent thanks to the 10 expansion slots and up to 24 2.5-inch hard disks. Thanks to the high availability offered by a choice of LAN cards, redundant fans and up to 4 hot-plug power supplies, the TX300 S7 is suited to database, virtualization or high performance computing scenarios. Moreover, the TX300 S7 power supplies reach energy efficiency levels of 94%, minimizing running costs and the environmental impact.

Positioning PRIMERGY Blade Servers

PRIMERGY BX900 S1

The PRIMERGY BX900 S1 is a rack unit that has an installed height of 10U and accommodates 1 to 18 server blades and 1 to 6 storage blades. The energy-efficient Intel Nehalem Quad-Core processors are used in the server blades. Ethernet, Fibre Channel and Infiniband networks are accessed via 8 switch bays. Switches from Cisco, Brocade and Emulex can be used. With its transfer rate of 6.4 Gb/s, the midplane used is the fastest on the market. 100V and 200V power supplies are available. This hardware platform is ideal for server consolidation and virtualization in the datacenter.

PRIMERGY BX600 S3

The PRIMERGY Blade Ecosystem provide high performance and maximum redundancy with minimum rack space, power consumption and cabling effort. PRIMERGY BX600 S3 can be equiped with up to ten Intel or AMD server blades, and are excellently suited for consolidation projects and for front- and mid-tier applications requiring enterprise-class availability, extreme flexibility and power efficiency. Due to its versatile design the system is ideal suited for smaller and mid market companies.

PRIMERGY SX650

This storage blade for PRIMERGY BX600 offers an easy and cost effective opportunity for server consolidation.
Rack and tower servers with high capacity of local hard disks are operating primarily in the area of small and medium enterprises. Very often it is essential having local access on large amounts of data; this for example applies to the wide area of Computer Aided Engineering (CAE), where smaller workgroups locally have to work on and create very large models.
Operation within confined environments as file servers as well as for Microsoft SharePoint Servers and Microsoft SQL Servers are popular usage cases.

PRIMERGY SX940 S1

The PRIMERGY SX940 S1 Direct Attached Storage Blade Disk can be used to extend the internal storage capacity of PRIMERGY BX92x Server Blades. A maximum of four internal disk drives greatly extends the maximum amount of disk storage of a Server Blade. One Storage Blade occupies a Blade slot within the PRIMERGY BX900 S1 system unit; it is positioned either on the left or right to an adjacent BX92x Server Blade, or between the two. The 1x 4 or 2x 2 disk drives of one SX940 S1 are driven by 1 or 2 integrated, highly functional SAS/RAID controllers with 512 Mbyte cache and BU. Each controller provides RAID levels 0, 1, 5 and 6. The connection to each Server Blade is realized via a midplane link to the high performing PCIe x4 interfaces of each Server Blade's system board.

PRIMERGY BladeFrame BF200

PRIMERGY BladeFrame BF400 S2

PRIMERGY BladeFrame is the platform to set up an application-independent and service-oriented IT infrastructure. The Processing Area Network (PAN) combines stateless servers (pBlades) with unique virtualization and management software, thus reducing the existing infrastructure complexity and providing a dynamic, high-availability system.
PRIMERGY BladeFrame uses the PAN architecture to manage a pool of computing, storage and network resources which can be dynamically allocated depending on business requirements. The PAN Manager is the central instance for configuring, managing and monitoring both the physical as well as virtual servers. With the PAN Manager a server is no longer a device with a defined configuration, operating system and application, but a software-based definition that can be dynamically assigned as needed. The PAN architecture thus expands the benefits of server virtualization and provides an integrated concept for high-availability (N+1 failover) and disaster recovery. The result is considerable savings in operational and total costs.
